

Did your Lawn Survive the Summer Heat?

Summer heat, drought and disease can do lasting damage to your lawn.

Excessive heat, days of drought, high humidity, and soil compaction can leave thin areas and bare spots in your lawn.

The only way to correct this problem before weeds have a chance to take over is to aerate and overseed with quality fescue.

Core Aeration

What is aeration? Practically speaking, aeration is the process of mechanically removing small plugs of thatch and soil from the lawn to improve natural soil aeration.

Aeration Benefits

- Improved air exchange between the soil and the atmosphere
- Enhanced soil water uptake
- Improved fertilizer uptake and use
- Reduced water runoff and puddling
- Stronger turf grass roots
- Reduced soil compaction
- Enhanced heat and drought stress tolerance
- Improved resiliency and cushioning
- Enhanced thatch breakdown

Overseeding

These small holes made by the aerator create the ideal environment for overseeding with our exclusive drought, heat and disease tolerant fescue.

Let Grounds Scapes Increase the Strength and Vigor of Your Lawn!

SPECIAL FALL SERVICES INCLUDE:

- Lawn Renovations • Soil Testing
- Roto-Till/ Roto Dairin (lawn preparation)
- Weed and Unwanted Grass Eradication
- Hydro-Seeding • Sod Installations • Drainage Applications
